

Hospitalized patients with CKD often unaware of it

16 September 2015

(HealthDay)—Hospitalized patients with chronic kidney disease (CKD) frequently are unaware of their condition, according to research published in the September issue of the *Journal of Hospital Medicine*.

Milda R. Saunders, M.D., M.P.H., of the University of Chicago, and colleagues conducted a [retrospective study](#) of 590 general medicine in-patients with CKD using ICD-9 codes for non-dialysis-dependent CKD from the first 20 admission diagnoses. Awareness of CKD was defined as correct patient self-report of "kidney problems."

The researchers found that 32 percent of patients were aware of their CKD. Of 161 patients with advanced CKD, 48 percent of patients with stage 4 CKD (estimated [glomerular filtration rate](#) [eGFR], 15 to 29) and 63 percent of patients with stage 5 CKD (eGFR
