

New Yorkers and coronavirus: Support for school closures, while most feel not at risk

16 March 2020

68% of those surveyed said they think closing schools and universities will help contain the spread of Coronavirus. Credit: CUNY SPH

A new CUNY Graduate School of Public Health and Health Policy (CUNY SPH) survey released today found that 60% of New York State residents believe their chances of contracting the novel Coronavirus are low or very low. The survey of 1000 New York households, conducted between March 13-15, 2020 and considered accurate within a range of 3%, also found that more than half (55%) of all respondents live in households with one or more members over age 60, the highest risk age group for Coronavirus infection. However, just more than one-fourth (27%) of them believed that they were living with someone who has a high chance of becoming sick. In general, a bare majority of New Yorkers (51%) said they have some knowledge of Coronavirus, while 34% believed they know a lot about it.

A substantial majority of New York residents believe that current policies help in containing the virus, including closing schools and universities (68%), limiting travel to and from certain countries (69%), and two weeks of quarantine for people exposed to the virus (71%).

Messages about ways to prevent the spread of the virus have led many residents to change their plans and routines in the past week. Almost one-

fourth (24%) of respondents reported they did not attend an event they had paid for due to concerns about the virus, and almost two in five respondents (39%) decided to stay home instead of going to work or changed existing travel plans (40%). Almost three in five (57%) said they had stayed at home instead of going to a restaurant or movie, and almost two-thirds (64%) say they have avoided shaking hands or hugging. The single recommendation that most respondents reported following regarded handwashing. Nine out of ten (88%) of New Yorkers reporting they increased the frequency of which they wash their hands or used hand sanitizer.

Almost three New Yorkers in ten (29%) rated television news ranked as the most trusted source of information about Coronavirus, followed by the CDC at 26%, and the WHO at 15%. Only 7% of respondents reported that President Trump was their most trusted source of information.

While an equally low percentage of respondents said social media were their most trusted information source, most people (51%) reported that they do share information on Coronavirus on these platforms at least once a day. Three in ten (30%) said they have passed along information on [social media](#) about Coronavirus without knowing it was accurate. The most frequently used online media sources respondents reported using were news media posts (36%), followed by friends (27%) and the government (20%).

"We conducted this survey and will update it regularly over the course of this public health crisis as a part of our unique mission within the City's largest public university," said CUNY SPH Dean Ayman El Mohandes. "Working together promoting evidence-based communication with innovative approaches for individual and community action, we can and will help address the threat of COVID-19."

The complete survey results and related commentary can be found at [sph.cuny.edu/research/covid-19 ... cking-survey/week-1/](https://sph.cuny.edu/research/covid-19...cking-survey/week-1/) and at JHC Impact, an initiative of the *Journal of Health Communication: International Perspectives*.

The CUNY SPH survey was conducted by Emerson College Polling from March 13-15, 2020. The sample for the NY Statewide results, n=1,000, with a Credibility Interval (CI) similar to a poll's margin of error (MOE) of +/- 3 percentage points. The [data sets](#) were weighted by gender, age, ethnicity, education and region based on the 2018 1-year American Community Survey model. It is important to remember that subsets based on gender, age, ethnicity and region carry with them higher margins of error, as the sample size is reduced. Data was collected using an Interactive Voice Response (IVR) system of landlines (n=477), SMS-to-online (n=360) and an online panel provided by MTurk and Survey Monkey (n=166).

The CUNY Graduate School of Public Health and Health Policy (CUNY SPH) is committed to teaching, research and service that creates a healthier New York City and helps promote equitable, efficient and evidence-based solutions to pressing health problems facing cities around the world.
